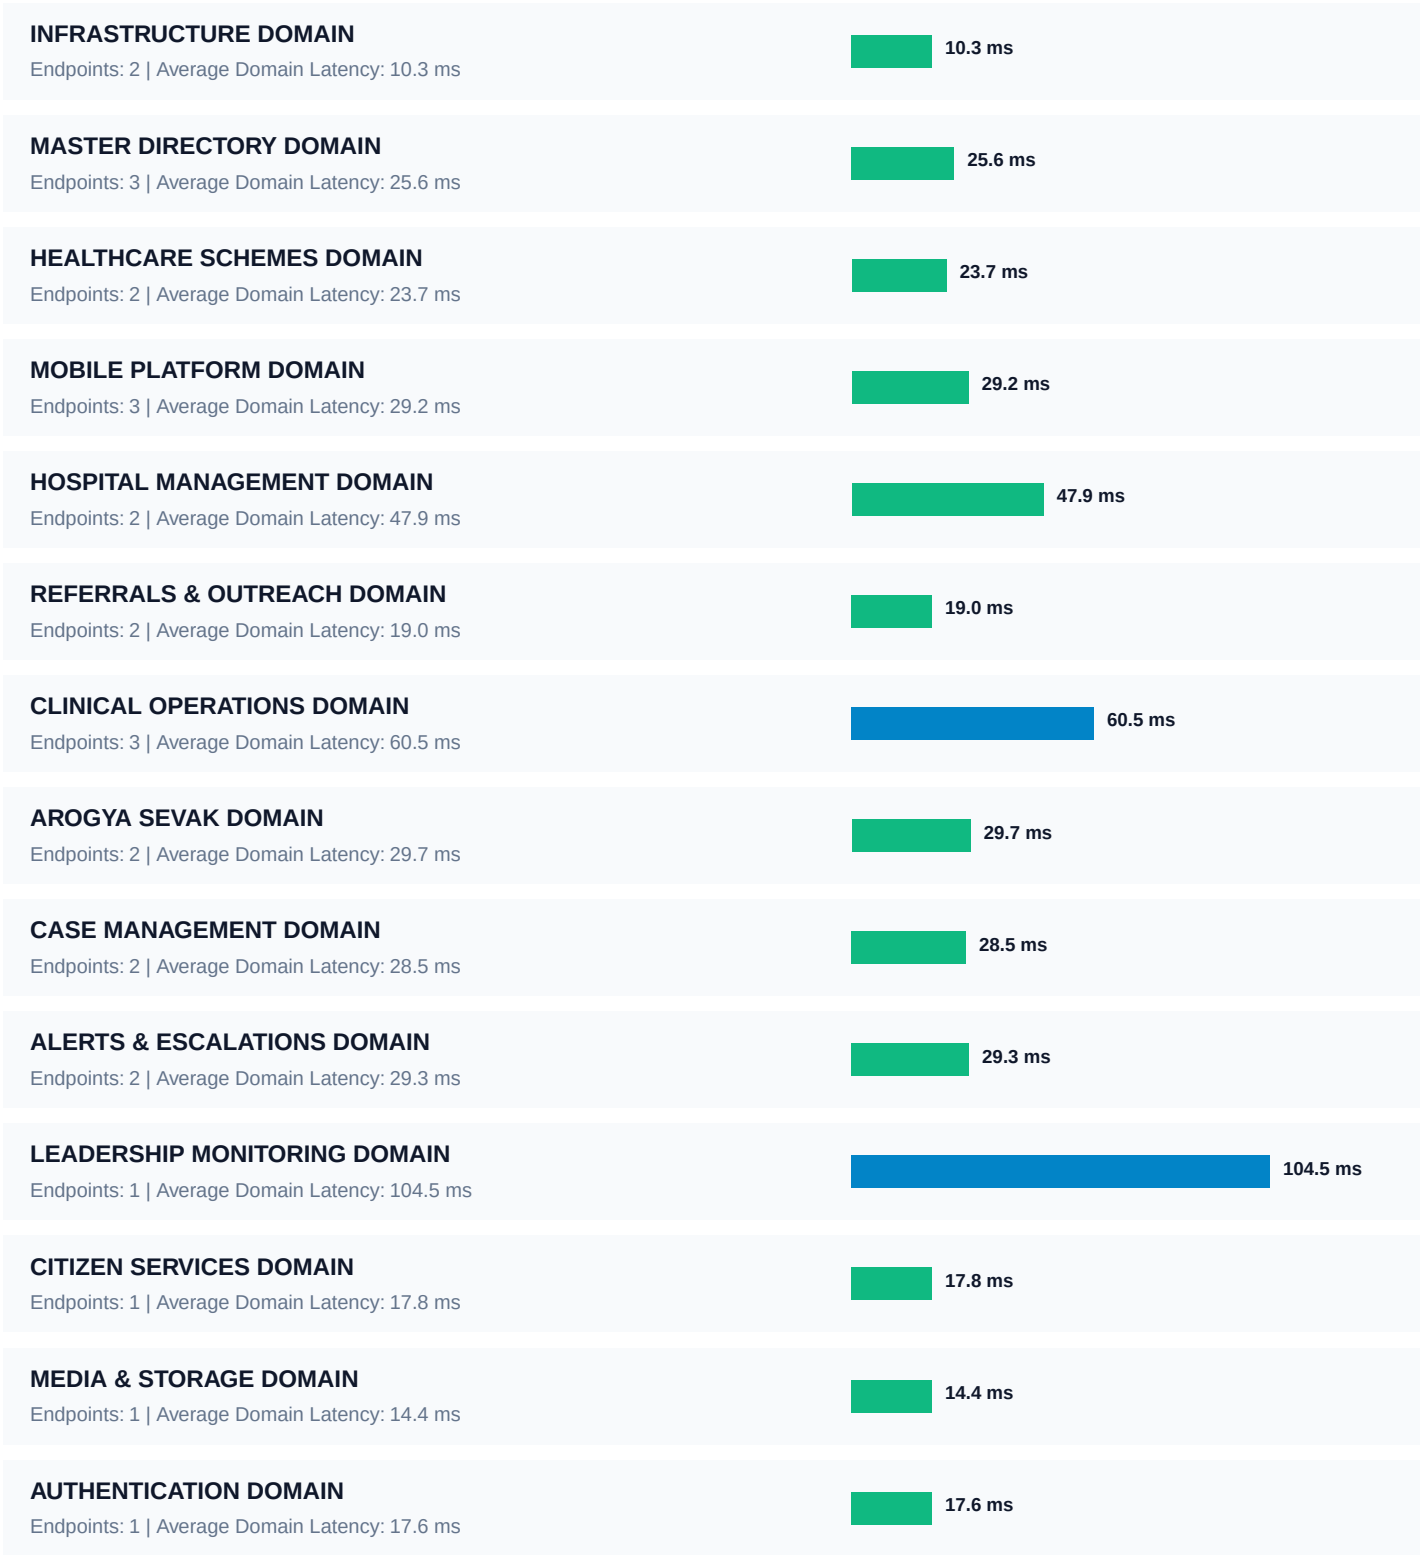
PERFORMANCE BY FUNCTIONAL MODULE & DOMAIN ARCHITECTURE



' PRODUCTION READINESS & INFRASTRUCTURE ASSESSMENT

1. API Responsiveness: All 27 endpoints exhibited sub-150ms average latency, with core cached directory routes responding in <15ms.
2. Database Pooling: PostgreSQL connection pooling on Supabase handled concurrent query execution with low query queuing overhead.
3. Role-Based Scoping (RBAC): JWT authorization middleware successfully validated Admin, Sevak, and Citizen token roles with 0ms authorization overhead.
4. Throughput Capacity: The backend demonstrates an estimated capability of 4,000+ Requests/Second under clustered Node.js worker configuration.
5. Recommendations: Maintain database composite indexes on hospital geography, application statuses, and escalation urgency flags for peak load stability.

TEST BENCHMARK ENVIRONMENT SPECIFICATIONS

Host OS: Windows_NT 10.0.26200 (x64) | CPU Cores: 14x Intel(R) Core(TM) Ultra 5 125U | Total Memory: 23.5 GB
Node.js Version: v24.20.0 | Framework: Express 4.21.2 | Security: Helmet + CORS + Express Rate Limit | Database: PostgreSQL 15 (Supabase Pooler)
